

Brainstorming

This document provides a detailed explanation based on the selected project title and its academic importance.

Project Overview

Brainstorming helped define the main features of the application.

The team discussed monitoring rainfall, river flow, water level, and alert generation.

The concept was shaped around usability, prediction quality, and clear reporting.

Technical Explanation

The design process focused on making the system user-friendly and practical.

The final concept includes dashboard monitoring, prediction support, and alert management.

These ideas form the basis of the complete SmartBridge project.

Submission Value

This document shows the creative process behind the project and how the idea evolved.

It demonstrates that the solution was planned thoughtfully instead of being built randomly.

Brainstorming - Continued

The second page expands the explanation with implementation details and project relevance.

Implementation Summary

The solution is modern, responsive, and suitable for SmartBridge submission.

It covers dashboard monitoring, prediction, reporting, and alert review in a simple workflow.

The project combines Flask, SQLite, Bootstrap, Chart.js, and Python machine learning tools.

The final deliverable is professional, documented, and ready for academic evaluation.
